

RAISED FASCIA

MC-10A

Anti-Ponding & Layering Details**NOTES:**

1. For recommended underlayment and fastening, see page 13, Table 1A, 1B & 1C
2. An anti-ponding device such as a beveled cant strip or shop-formed sheet metal is required at all raised fascia conditions to support the underlayment and provide positive drainage.
3. The tile and/or batten fasteners must penetrate a minimum into dimensional wood decking or pass through wood panel sheathing whichever is less. Once the batten is installed, it becomes part of the "deck" or substrate for tile fastening.
4. Raise fascia board above roof deck to height equal to combined thickness of batten system and thickness of one course of tile.
5. Dimensions shown are minimums and are intended to be approximate to allow for reasonable tolerances due to field.
6. Since raised fascia and starter strips create the same type of water dam situation, they both require an anti-ponding system to allow water to flow off the roof.

Drawing shown depicts the application of all tile profiles. Unless otherwise noted, it would apply to either concrete or clay tiles.
